Share across projects

Problem

Three key limitations:

1. **No Sharing**: Teams can't reuse test cases across projects, forcing manual duplication.
2. **Inconsistent Updates**: Changes to common test cases must be copied manually, risking outdated tests.
3. **Fragmented Testing**: Test Runs/Plans can't pull test cases from multiple projects, making cross-team collaboration inefficient

Solution

Shared Test Cases with granular access controls

- can be used by Test Runs in other projects
- A shared test case folder mean, all are shared
- A shared project DOES NOT mean all its test cases are shared.
